

OpenYuGi Setup Guide

Extremely beginner-friendly instructions for Windows, macOS, and Ubuntu

Good news: This guide assumes you have never used a terminal before. Every command is written out exactly. You do not need to guess what folder to open.

What this repo currently expects

- The repo is a Python project.
- Its dependencies are listed in requirements.txt.
- You start it from the project root with python main.py.
- It should open in your browser at `http://localhost:8080`.

The GitHub repo page. The green Code button is where Download ZIP lives, but this guide uses Git so updates are easier.

Before you start

What is a command line? It is just a text window where you type commands. On Windows we will use **Anaconda Prompt**. On macOS and Ubuntu we will use **Terminal**.

A command window. The blinking cursor is where you type.

Do not panic: When a command finishes successfully, the window usually shows a new line and waits for the next command. If you see lots of text scroll by during installation, that is normal.

Quick plan

1. Install Git so your computer understands the git clone command.
2. Install Miniconda.
3. Create a Conda environment called openyugi with Python 3.10.
4. Download the repo into an easy-to-find folder.
5. Install the repo dependencies with `pip install -r requirements.txt`.
6. Start the app with `python main.py`.

Windows guide

Part A. Install Git on Windows

- Open your web browser and go to the Git for Windows download page.
- Download and run the installer.
- Keep the default choices unless you already know you want something different.

Optional command: If you prefer a command, recent Windows versions can also install Git with winget. You do not need this if you already used the normal installer.

```
winget install --id Git.Git -e --source winget
```

Part B. Install Miniconda on Windows

- Open the Miniconda download page.
- Download the Windows installer.
- Run the installer and keep the default options.
- When it is finished, open the Start menu and launch Anaconda Prompt.

Part C. Create your working folder and clone the repo

Creating a simple folder, downloading the repo, and making the Conda environment.

Type these commands in Anaconda Prompt

```
cd %USERPROFILE%
mkdir openyugi-setup
cd openyugi-setup
git clone https://github.com/DJ-Cat-N-Cheese/Yu-Gi-Oh-Card-Tracker.git
```

OpenYuGi beginner setup guide

```
cd Yu-Gi-Oh-Card-Tracker
```

You are now in the right folder: The folder path after these commands will be C:\Users\YOUR-NAME\openyugi-setup\Yu-Gi-Oh-Card-Tracker. That is the exact project folder.

Part D. Create the Conda environment called openyugi

```
conda create -n openyugi python=3.10 -y
```

Why this step matters: This creates a clean little workspace named openyugi and installs Python 3.10 inside it.

Part E. Turn the environment on

```
conda activate openyugi  
python --version
```

Success sign: If the line starts with (openyugi), the environment is active.

Part F. Install the project dependencies

```
Anaconda Prompt  
  
(openyugi) C:\Users\YourName> cd %USERPROFILE%\Downloads\Yu-Gi-Oh-Card-Tracker-main  
(openyugi) C:\Users\YourName\Downloads\Yu-Gi-Oh-Card-Tracker-main> pip install -r requirements.txt  
Collecting nicegui  
Collecting pydantic  
Collecting Pillow  
... lots of lines ...  
Successfully installed ...
```

Installing the packages from requirements.txt. This can take several minutes.

```
pip install -r requirements.txt
```

Normal behavior: This repo has some big packages. The first install can take a while, especially on a slower internet connection.

Part G. Start OpenYuGi

Starting the app from the project folder.

```
python main.py
```

If everything went well, OpenYuGi should appear in your web browser.

If nothing pops up: If your browser does not open by itself, manually type `http://localhost:8080` into the address bar.

Part H. Next time you want to open it again

```
cd %USERPROFILE%\openyugi-setup\Yu-Gi-Oh-Card-Tracker
conda activate openyugi
python main.py
```

macOS guide

Part A. Install Git on macOS

- Open the Terminal app.
- Type the command below.
- A macOS pop-up may appear asking to install Command Line Tools. Click Install.

```
xcode-select --install
```

Part B. Install Miniconda on macOS

- Open the Miniconda download page.
- Download the macOS installer that matches your Mac.
- Run the installer.
- Close Terminal and open it again after installation.

Part C. Make your folder, clone the repo, and prepare Conda

macOS Terminal example.

```
cd ~
mkdir -p openyugi-setup
cd ~/openyugi-setup
git clone https://github.com/DJ-Cat-N-Cheese/Yu-Gi-Oh-Card-Tracker.git
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker
source ~/miniconda3/etc/profile.d/conda.sh
```

Important one-time-in-this-window step: The source command teaches the current

OpenYuGi beginner setup guide

Terminal window where Conda lives.

Part D. Create and activate the openyugi environment

```
conda create -n openyugi python=3.10 -y
conda activate openyugi
python --version
```

Part E. Install dependencies and start the app

```
pip install -r requirements.txt
python main.py
```

Open the app: Then open <http://localhost:8080> in Safari, Chrome, or another browser if it does not open by itself.

Part F. Next time you want to open it again

```
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker
source ~/miniconda3/etc/profile.d/conda.sh
conda activate openyugi
python main.py
```

Ubuntu guide

Part A. Open Terminal

Press the Super key (the Windows key on many keyboards), type Terminal, and open it.

Part B. Install Git and the Miniconda installer helper tools

```
Ubuntu example
$ sudo apt update
$ sudo apt install -y wget git bzip2
$ cd ~/Downloads
$ wget https://repo.anaconda.com/miniconda/Miniconda3-latest-Linux-x86_64.sh
$ bash Miniconda3-latest-Linux-x86_64.sh
$ source ~/miniconda3/etc/profile.d/conda.sh
$ conda create -n openyugi python=3.10 -y
$ conda activate openyugi
```

Ubuntu Terminal example.

```
sudo apt update
sudo apt install -y wget git bzip2
```

Part C. Download and install Miniconda

```
cd ~/Downloads
wget https://repo.anaconda.com/miniconda/Miniconda3-latest-Linux-x86_64.sh
bash Miniconda3-latest-Linux-x86_64.sh
```

What to answer: During the installer: press Enter to scroll the license, type yes to accept, and accept the default install location unless you have a special reason not to.

Part D. Turn Conda on in this Terminal window

```
source ~/miniconda3/etc/profile.d/conda.sh
```

Part E. Make your folder, clone the repo, create the environment, install dependencies, and start the app

```
cd ~
mkdir -p openyugi-setup
cd ~/openyugi-setup
git clone https://github.com/DJ-Cat-N-Cheese/Yu-Gi-Oh-Card-Tracker.git
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker
conda create -n openyugi python=3.10 -y
conda activate openyugi
python --version
pip install -r requirements.txt
python main.py
```

Part F. Next time you want to open it again

```
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker
source ~/miniconda3/etc/profile.d/conda.sh
conda activate openyugi
python main.py
```

Optional: scanner / OCR extras

For the basic app, start with the core setup above first. **Do not block yourself on OCR tools before you know the main app launches.**

- The repo README lists Tesseract as an optional scanner dependency.
- If you only want the collection manager running, do the main setup first.
- Add scanner extras later if you need webcam OCR features.

Tesseract commands, if you decide to add it later

```
Windows: install from the Tesseract installer and make sure "Add to PATH" is checked
macOS:   brew install tesseract
Ubuntu:  sudo apt install -y tesseract-ocr
```

Very common beginner problems

I typed a command and got “not recognized” or “command not found”.

That usually means the tool is not installed yet, or you opened the wrong window. On Windows, use Anaconda Prompt after installing Miniconda. On macOS and Ubuntu, reopen Terminal after installing tools.

conda activate openyugi says Conda is not initialized.

On macOS or Ubuntu, run `source ~/miniconda3/etc/profile.d/conda.sh` and then try `conda activate openyugi` again.

python main.py says it cannot find src.

You are probably in the wrong folder. Go back to the exact project folder and try again.

pip install -r requirements.txt failed halfway through.

Check that your internet connection is stable and run the same `pip install` command again. Big machine-learning packages sometimes need a second try.

The app starts but no browser opens.

Manually open your browser and go to `http://localhost:8080`.

How do I stop the app?

Go back to the command window and press `Ctrl+C`.

A screenshot of a macOS Terminal window titled "Terminal". The window has a dark blue background with light blue text. The text inside the terminal shows the following sequence of events: 1. A message "When you want to stop OpenYuGi" is displayed. 2. The user enters the command `(openyugi) ...> python main.py`. 3. The terminal responds with "NiceGUI ready to go on http://localhost:8080". 4. The user presses Ctrl+C, which is shown as `^C`. 5. The terminal responds with "App stopped.".

```
When you want to stop OpenYuGi
(openyugi) ...> python main.py
NiceGUI ready to go on http://localhost:8080
^C
App stopped.
```

To stop OpenYuGi, go back to the command window and press `Ctrl+C`.

Cheat sheet: fastest possible reopen commands

Windows

```
cd %USERPROFILE%\openyugi-setup\Yu-Gi-Oh-Card-Tracker  
conda activate openyugi  
python main.py
```

macOS

```
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker  
source ~/miniconda3/etc/profile.d/conda.sh  
conda activate openyugi  
python main.py
```

Ubuntu

```
cd ~/openyugi-setup/Yu-Gi-Oh-Card-Tracker  
source ~/miniconda3/etc/profile.d/conda.sh  
conda activate openyugi  
python main.py
```
